Eculer Graph

Euler propose that it some closed walk in a graph contains all the edges of the graph, then the graph is called an euler line: and the graph that contains Euler line is called . Euler graph. Euler graph's don't have any isolated Vertices and they are always connected.

eximited the section of the section

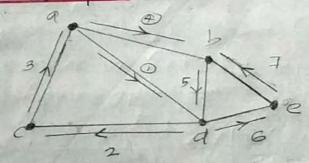

Euler the graph

Unicursal Line

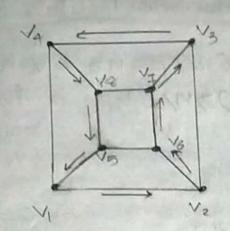

An open walk-that includes all edges of a graph without replacing any edge is called open Euler line or unicursal line.

Uncursal graph.

Hamitonian Circuit

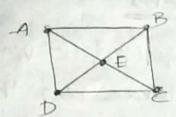

A circuit in a connected graph 'G' is said to be Hamiltonian, it it includes every vertex of

Hamiltonian Path

86/08

Hamiltonian clacuits are named after william Rowan Hamiton.

Examples of Hamiltonian Ration

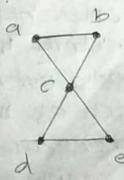

A.B.E.C.D

E.B.A.D.C

Example for Hamiltonian circuit:

Arbitarrily Traceable Graphs

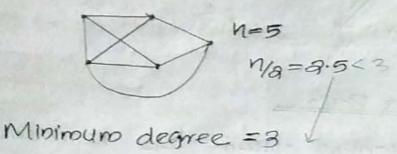

A vertex 'v' in an Euler graph has a property that an Euler line o is always obtain when one follows any walk from vertex such a graph is called an Arbitrarily Traceble graph from vertex v.

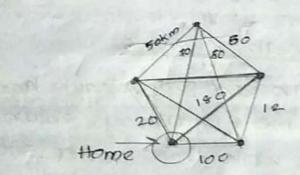

Dinac's Theorem for Hamiltonicity.

Every Graph 'Gi' with 173 vertices and minimum degree dCOD711/2 has a hamiltonian Cycle.

Travelling Salesman Problem

A salesman is required to visit a no. of cities. given the distance but the cities, in what order should be travelled so has to visit every city exactly once and return home, with minimum distance travelled?

We can represent the cities by vertices of the operates connecting these cities by edges. Here we use a weighted graph, where the weight or the distance is associated with every edge.

has a good to want other cities and we have completed coeignted graph such a complete

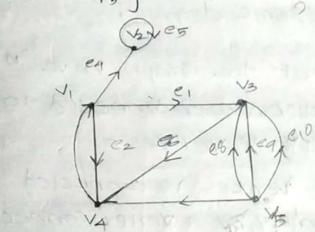

Scanned by CamScanner

coerabled graph have asseveral hamiltonian all we only choose the ckt cobich result in grallest sum of nesults.

Theorectically other padolero of travelling sale's man can be solved by eliminating all the (b-1)! hamiltonian ckt, calculating the distance travelled in each and choosing the sportest one.

Directed Graph (Digraph)

A directed graph 'GI' consists of set of Vertices V= & v, v2, v3. -.. } and set of edges E= {e1, e2, e2. - 3 fa mapping of that maps every edge on the to some ordered pair vertices vi, vi

& owdegree of Vertices VI, V2, & V5

14 There is an edge ex from vertex Vi to v, the vertex vi is called initial vertex of vi and the vertex v; is called terminal vertex of vj.

? Calculated indegree four degree of vertices V1, V2, V5

Indegree
$$(v_1) - 1$$

(v_2) - 2

(v_5) - 0

agree
$$(V_1) - 1$$
 outdegree $(V_1) = 3$
on $(V_2) - 2$ outdegree $(V_2) = 01$
on $(V_3) - 0$ outdegree $(V_3) = 4$

One's Theorem

27/08

The graph 'G' is arbitary traceble from a vertex 'v' iff every cycle in 'G' Contains'V.

? Prove that the surp of degrees of the Vertices of any finite graph is even.

Either the degree of two vertices is Increased by 1 or degree of I vertex is 1 sed by 2. is sum of degree of vertices is always increased by a.

? Show that every simple finite graph has a vertices of the same degree.

Each of those vertices are connected to either 0,1,2,... h-1 other vertices.

If any of vertices is connected to mi vertices, there cannot be a vertex connected to o vertices. It is impossible bave a graph comb b vertices Such that I vertex has degree o and another has degree n-1.

Hand shaking Problem

showthat it is people at in the party and some shake hand with others but not with themselve, then at the end there are atleast a people who have shaken bands with same no of peoples.

This is similar to the previous problem. Here, each person attending the party is vertex and every shake hand is an edge.

o prove that a complete graph with 'n' vertices contains n(n-1) edges.

proof by induction.

if n=1, edges=0

20 P(1) is true.

Assume that it is toue for n=k.

ie, P(K)

ie, A complete graph with k vertices has K(K+1) edges.

Now, let n=k+1

Then complete graph with k+1 vertices has

P(k+1) = (k+1)(k+1-1) = (k+1)k edges.

Hence proved.

One's theorem proof:

A connected graph is an Euler graph iff every vertex have no even degree,

The Eculer ckt in the graph must enter and leave vertex. Each visit to a vertex requires both entry and exist edges. So every vertex has even degree.

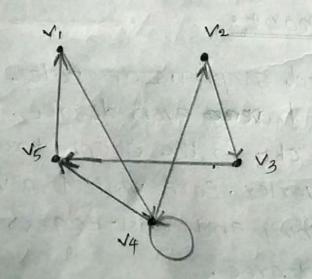

- ? Show that any graph in which degree of every vertex is even has an Euler ckt.
- 9 8how that if there are exactly a vertices AfB of odd god degree, there is an ewer path from A to B.
- ? 8 how that, if there are more than a vertices of odd degree with impossible to construct euler path.

29/08

? Let 'D' be the digraph whose vertex set is $V = \{V_1, V_2, \dots, V_5\}$ and directed edge set is $E = \{(V_1, V_4), (V_4, V_3), (V_3, V_5), (V_4, V_2), (V_4, V_4), (V_4, V_5), (V_5, V_1)\}$

Draw the digraph for each of the vertices give indegree and outdegree.

Vertices	Vi	V2	V3	Vq	45
octdegree dtv	1	1	1	2	2
indegree d'(v)	1	ı		1 2	a

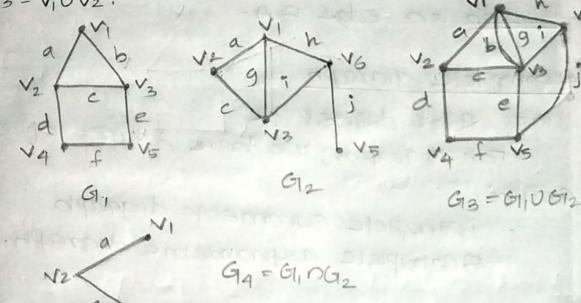

Their temple

operations of graph

Ototo:

) Union & Intersection.

Union of a graphs $G_1=(V_1,E_1)$ & $G_2=(V_2,E_2)$. Another graph G_1 3 such that $G_3=G_1\cup G_2$ cohere G_3 0 $V_3=V_1\cup V_2$.

Ring sum

It is a graph consisting of the vertex set VIVVa of edges that are either in 61 or in 612 but not in both.

Types of digraph

- Dsimple
- a) assymmetric
- 3) Symmetric
- 4) Complete
- 1) Simple digraph

It is a digraph, it has no self loop or parallel edges

a) Assymmetaic

digraphs that has almost one directed edge which means a pair of vertices. But we allowed to have self loop.

3)Symmetalc

Digraphs in which every edge A-B There is also an edge BA.

4) complete digraph

the defined as

For digraphs, we have a types of complete

Domplete symmetric digraph.

Demplete symmetric digraph.

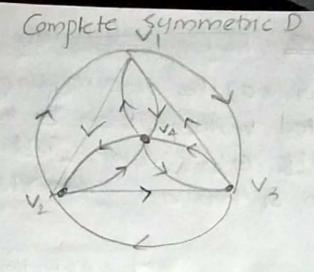

there is exactly one edge directed from each vertex to every other vertex

a) Complete assymmetric digraph

in which has an edge blue every pair of vertices.

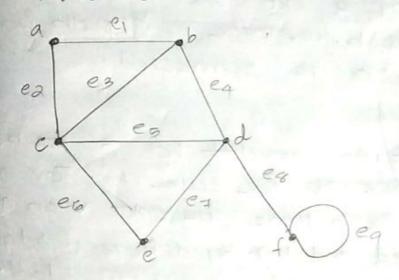

in' vertices has n(n-1) edges.

in vertices has n(n-1) edges.

Tracil

A trail is a walk with distinct edges.

Toail: a, e, b, e3 c; e5, d, e8, f

Check conether the given sequence is tooil?

C, e3, b, e4, d, e5, C, e3, b, e1; a; e2, C

No, edges are repeated

Path

It is a walk with distinct vertices.

Theorem

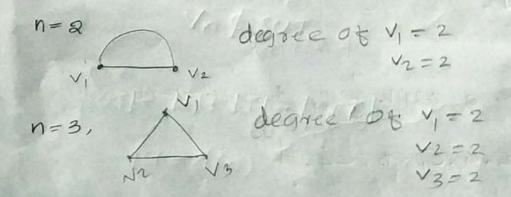

Let G=(V, E) be an undirected graph, with no isolated vertices, then G has an Ewer circuit iff 'G' is connected and every vertex in G has an even degree.

Proof.

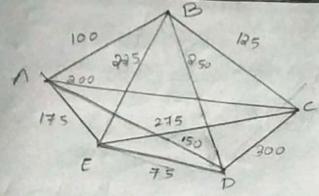

If 61 has an ewer ckt, then for all a, bey [+ a, b \in V], there is a trail from a and b.
That part of a ckt starts at a and terminates at b. ie, there is a path from a-b. Hence '61' is connected.

Hence '61' is connected let's' con be the starting vertex of the euler cht. For any vertex V(G) each time we enter von the cht. its ended and left by different edges thus each occurrence of boonsist of 2 edges or has a degree 2 or has an even degree.

since the cut is connected and the degree of the each vertex is even degree when n=1 (De) degree is 2.

DIRAC'S THEOREM

outto ny3 and degree of vertex y, n/2. [d(v)>n] for every vertex v, then G is pamiltonian.

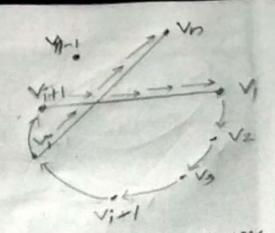

PA E SUT

Proof

Suppose that there exist a non-hamiltonian graph. Then there will be a maximal non-hamiltonian graph G with h vertices and degree of V n/2 [dov) >, n/2] for every V & G.

.. There exist two non-adjacent vertices Vi+1 and Vi.

There will be two nonadjacent vertices us vin 6. : a is maximal and nonbamiltonian. Gruv should be hamiltonian.

Let c' be the hamiltonian cycle in a+uv.

Let c=41, V3, V3, Vi-1, Vi, Vi+1, ... Vn-1, Vb, V

Let Vn=u and Vi=v. Define sas ViEC.

That means there exist an edge.

S= { viEc : I an edge from a to vi+1}

T = { viEc : I an edge from v to vi+1}

It in es ithen there exists an edge from n to Vn+1 and there exist a loop from u to u.

This happens to be contradiction so assumption is wrong.
